

**All environmental
information
at a simple click**

CEFIBLUE is the system that allows to **collect, store, integrate, analyze, report and distribute in web format, the environmental information** obtained from distributed instruments and treatment plants, geographically disperse and running with different control systems.

Based in **entrenched experience**, both in **corporate information systems in industrial sectors** as in heterogeneous **control systems integration** and in data collection and GPRS transmission, **CEFISA** has developed **CEFIBLUE**: the environmental management information system.

Data from already installed **water and air** analysis systems, acoustic pollution measuring systems, environmental parameters (such as temperature, humidity, atmospheric pressure, solar radiation, intensity and direction of the wind...) are transmitted and stored in a historian database, with no time limitation and with no precision loss. With all of them, a **real time statistic information system is created, accessible through a web site** that can be made public or private.
